

GlassBench NPZ ensemble-member horizon

Inner-tar prefix probes count visible NPZ members before multi-member extraction or real reanalysis.

target	stage	member-count evidence
KA T=none	trajectory layout incomplete	prefix members=0; extracted curves=0; threshold=4; gap=4; extraction=0 split=none; tar probe=0 bytes; first=none next=complete inner tar layout probe
KA2D T=0.23	member index horizon ready extraction bloc	prefix members=9; extracted curves=1; threshold=4; gap=0; extraction=0 split=test; tar probe=1048576 bytes; first=T0.23/test/N1290T0.23_202_tc05.npz next=extract indexed npz members and compute uncertainties
KA2D T=0.30	member index horizon ready extraction bloc	prefix members=10; extracted curves=1; threshold=4; gap=0; extraction=0 split=train; tar probe=1048576 bytes; first=T0.30/train/N1290T0.30_3_tc01.npz next=extract indexed npz members and compute uncertainties

The horizon counts headers visible in the prefix only; it does not claim multi-NPZ extraction, uncertainties, or real inversion.
