

GlassBench acquisition outcome matrix

Pass/fail outcomes for each future acquisition panel are preregistered before the data are acquired.

panel	branch	allowed claim
multi temperature threshold sweep member pan	pass	threshold robust event clock candidate not pe inversion PE=0; mechanism=0; thermo=0; interpretation=fixed lag threshold clock not rejected by threshold
multi temperature threshold sweep member pan	fail	fixed lag threshold event clock rejected PE=0; mechanism=0; thermo=0; interpretation=threshold crossing not valid event clock
physical time event clock inversion panel	pass	uncertainty weighted real pe inversion candidate PE=1; mechanism=0; thermo=0; interpretation=micro to macro prediction test enabled
physical time event clock inversion panel	fail	real pe inversion rejected or model reparameterization required PE=0; mechanism=0; thermo=0; interpretation=renewal cage microdynamic closure not supported by p
tc50 late recovery mechanism power panel	pass	finite exchange supported static disorder rejected PE=0; mechanism=1; thermo=0; interpretation=late gaussian recovery mechanism selection enabled
tc50 late recovery mechanism power panel	fail	finite exchange rejected or static disorder not rejected PE=0; mechanism=1; thermo=0; interpretation=late ngp recovery does not select finite exchange

This matrix prevents after-the-fact promotion of future acquisition results into stronger claims.
