

GlassBench event-clock threshold readiness

Real threshold-robustness claims require cached particle trajectories, physical time, and held-out macro observables.

target	readiness stage	real-input gate
KA2D T=0.23	real event clock threshold robustness blocked	schema=1; curve=1; members=1; particle cache=1; threshold sweep=0; blocker=physical_time_semantics missing=physical_time_semantics;macro_heldout_observables;threshold_sweep_event_clock
KA2D T=0.30	real event clock threshold robustness blocked	schema=1; curve=1; members=1; particle cache=1; threshold sweep=0; blocker=physical_time_semantics missing=physical_time_semantics;macro_heldout_observables;threshold_sweep_event_clock

The gate is intentionally conservative: schema visibility is not treated as a real particle-event threshold sweep.
