

GlassBench frame-time mapping audit

Candidate mappings are classified before attaching result time grids to trajectory frame-index curves.

target	mapping stage	candidate checks
KA2D T=0.23	ambiguous frame time mapping	ready=0; exact=0; stride=0; interpolation=1; ratio=2.71 accepted: none; provisional: endpoint interpolation requires metadata metadata: dump interval;saved frame stride;trajectory frame origin;result time generation
KA2D T=0.30	ambiguous frame time mapping	ready=0; exact=0; stride=0; interpolation=1; ratio=3.8 accepted: none; provisional: endpoint interpolation requires metadata metadata: dump interval;saved frame stride;trajectory frame origin;result time generation

Endpoint interpolation alone is kept as provisional and cannot support a publishable trajectory-time inversion.
