

# GlassBench real-inversion unlock protocol

Minimum additional payload required before promoting real-data canaries to uncertainty-weighted trajectory inversion.

| target      | unlock stage                           | minimum missing payload                                                                                                                                                                                                           |
|-------------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KA2D T=0.23 | minimum real inversion payload missing | frames=20; result times=8; mapping=0; extra members=1<br>payload: frame time mapping;one more independent npz member;lag time;sigma msd;sigma ngp 2d;sigma self i<br>after unlock: uncertainty weighted real trajectory inversion |
