

Stationary finite-flight closure on continuous KA trajectories

Event statistics are calibration inputs; diffusion, transient NGP, multi-k Fs, and cooling trends are held out.

A. T=0.45 diffusion relative error

B. T=0.58 transient NGP absolute error

Cold correction uses measured event-lag correlations $C1/q=-0.05485$ and $C2/q=-0.05191$; relative diffusion error is 1.05%.
Cooling increases τ_p/τ_x , $D \tau_\alpha$, NGP, and overlap susceptibility; the gamma count-variance closure remains partial at T=0.45.
