

GlassBench cached alpha-anchor Fs audit

Structure-matched cached displacements directly test the proposed higher-k alpha anchor.

target	cached stage	direct cached Fs measurement
KA2D T=0.23	cached direct anchor root refines required k	structure=151; lag=1.5e+06; candidate k=2.7; cached Fs=0.528 log-grid k*=3.01; direct k_root=4.8; direct/candidate=1.78; crossed=0 blocker=cached_direct_anchor_wave_number; next=recompute_cached_fs_at_direct_alpha_anchor
KA2D T=0.30	cached anchor upstream incomplete	structure=none; lag=0; candidate k=0; cached Fs=0 log-grid k*=0; direct k_root=0; direct/candidate=0; crossed=0 blocker=alpha_anchor_rescue_design; next=complete_alpha_anchor_rescue_design_before

A cached structure-specific refinement remains a dynamical alpha-anchor check, not an event-clock or thermodynamic claim.
