

GlassBench alpha-threshold horizon audit

Tau-alpha metadata is checked against the anchor $F_s=e^{-1}$ crossing used by the persistence/exchange inversion.

target	audit stage	threshold and inversion status
KA2D T=0.23	metadata tau alpha anchor fs mismatch	tau reached=1; alpha crossed=0; consistent=0; blocker=anchor_wave_number_or_alpha_definition_mismatch latest t/tau_alpha(meta)=1.63; anchor $F_s=0.763$; extension=1.64e+03x PE inversion=0; thermodynamic claim=0; next=verify_alpha_definition_or_extend_archive_to_threshold_cro
KA2D T=0.30	timecode curve upstream incomplete	tau reached=0; alpha crossed=0; consistent=0; blocker=sparse_time_code_coverage latest t/tau_alpha(meta)=5e-05; anchor $F_s=0$; extension=0x PE inversion=0; thermodynamic claim=0; next=complete_timecode_curve_before_alpha_horizon_audit

A metadata/anchor- F_s mismatch blocks real-data inversion until the alpha definition or longer horizon is resolved.
