

Dynamical-glass claim ladder

The delayed-renewal theory promotes derived dynamical signatures while blocking thermodynamic and direct spatial overclaims.

Theory status

- derived dynamic signature
- conditional barrier law signature
- proxy spatial closure
- out of scope thermodynamic transition
- unsupported in current parameter law

Fragility remains conditional on an imposed barrier law.
chi4 is a renewal/domain proxy, not a direct four-point spatial derivation.
Thermodynamic transition claims are explicitly outside the dynamical renewal scope.

Supported public-claim levels
