

GlassBench cached-particle time-code bridge

Cached first-NPZ coordinates have official lag times, but axis 0 is isoconfigurational replicas rather than physical time.

target	bridge stage	lag-time and axis semantics
KA2D T=0.23	cached particle lag time ready event clock blocked	code=tc05; lag=0.1; cache=1; lag ready=1; frame-axis time=0; event clock=0 axis0=isoconfigurational_trajectory_replicas; blocker=frame_axis_is_isoconfigurational_replicas
KA2D T=0.30	cached particle lag time ready event clock blocked	code=tc01; lag=0.11; cache=1; lag ready=1; frame-axis time=0; event clock=0 axis0=isoconfigurational_trajectory_replicas; blocker=frame_axis_is_isoconfigurational_replicas

The bridge upgrades lag-time semantics but explicitly blocks event-clock claims from fixed-lag replica axes.
