

GlassBench real evidence claim synthesis

Real cached evidence, direct-alpha predictions, mechanism selection, and scope boundaries are reduced to manuscript-safe claim levels.

claim row	stage	claim flags	allowed claim / blocker
real dynamic signature support	real dynamic signatures supported preinversion	cand=1; claim=1; real=1; PE=0; thermo=0	dynamical signature supported blocker=none
cached multik alpha shape predicti	multik alpha candidate preregistered post window	cand=1; claim=0; real=1; PE=0; thermo=0	cached multik alpha candidate blocker=post alpha window obs
conditional alpha transport pe bou	conditional transport pe bound ready event clock	cand=1; claim=0; real=1; PE=0; thermo=0	conditional alpha transport bou blocker=event clock jump varian
real mechanism selection	mechanism selection preregistered late recovery	cand=1; claim=0; real=0; PE=0; thermo=0	preregistered real mechanism s blocker=late recovery measure
thermodynamic scope boundary	thermodynamic transition out of scope	cand=0; claim=0; real=0; PE=0; thermo=0	dynamical glass signatures only blocker=thermodynamic input la

This synthesis is a claim-level ledger: it supports dynamical signatures while keeping PE inversion and thermodynamics blocked.
