

GlassBench real-data closure priority ledger

Minimum real payloads are ranked by which dynamical diagnostic claims they unlock; thermodynamic claims stay disallowed.

rank	closure payload	claim unlocked and required data
#1	physical time event clock and cage jump se	stage=minimum real inversion closure priority; blockers=4; inversion=1; micro-macro=1; alpha=0; mechanism=0; spatial=0; thermo=0 payload=frame time mapping;lag time;sigma msd;sigma ngp 2d;sigma self intermediate scattering post-unlock=uncertainty weighted real microdynamic inversion and heldout macro prediction
#2	post alpha multik fs targets	stage=heldout alpha prediction priority; blockers=6; inversion=0; micro-macro=0; alpha=1; mechanism=0; spatial=0; thermo=0 payload=observe tc45 Fs multik;observe tc50 Fs multik;sigma self intermediate scattering by k; post-unlock=heldout multik alpha shape prediction test
#3	late ngp recovery and exchange horizon	stage=mechanism selection priority; blockers=3; inversion=0; micro-macro=0; alpha=0; mechanism=1; spatial=0; thermo=0 payload=observe tc50 late ngp;sigma late ngp;late self van hove tail;exchange clock fit post-unlock=finit exchange vs static disorder real mechanism selection
#4	direct four point function and dynamic len	stage=spatial four point boundary priority; blockers=1; inversion=0; micro-macro=0; alpha=0; mechanism=0; spatial=1; thermo=0 payload=direct four point susceptibility;dynamic correlation length;physical time chi4 uncerta post-unlock=direct four point susceptibility and dynamic length claim

This is a real-data closure ledger, not a claim that the present cache already contains a complete microdynamic inversion.
