

GlassBench manuscript claim registry

Current claims, future upgrades, failure obligations, and scope boundaries are locked to explicit gates.

registry row	stage	allowed manuscript claim
current dynamic signature claim	publishable now preinversion	dynamical signature supported now=1; future=none; PE=0; reject=0; thermo=0
future threshold event clock candidate	future panel outcome required	threshold robust event clock candidate not pe inversion now=0; future=multi temperature threshold sweep ; PE=0; reject=0; thermo=0
future real pe inversion candidate	future panel outcome required	uncertainty weighted real pe inversion candidate now=0; future=physical time event clock inversio; PE=1; reject=0; thermo=0
future finite exchange selection claim	future panel outcome required	finite exchange supported static disorder rejected now=0; future=tc50 late recovery mechanism power; PE=0; reject=0; thermo=0
event clock failure retraction obligatio	future failure rejection locked	real pe inversion rejected or model reparameterization required now=0; future=physical time event clock inversio; PE=0; reject=1; thermo=0
late recovery failure rejection obligati	future failure rejection locked	finite exchange rejected or static disorder not rejected now=0; future=tc50 late recovery mechanism power; PE=0; reject=1; thermo=0
thermodynamic transition boundary	scope boundary locked	dynamical glass signatures only now=0; future=none; PE=0; reject=0; thermo=0

The registry is the manuscript wording lock: future data can upgrade or reject claims only through named gates.
