

Microdynamic prediction scorecard

Few microdynamic statistics must predict held-out macro signatures; current GlassBench support remains prediction-gated.

row	stage	accounting	claim/blocker
synthetic event clock macro predict	microstats to macro prediction passed	micro=4; held=4; fit=0; real=0; members=0->0	synthetic microdynamic closure can blocker=none
synthetic event clock macro late ng	heldout macro prediction rejected	micro=4; held=4; fit=0; real=0; members=0->0	synthetic negative control rejected blocker=late ngp prediction pass
synthetic minimal dynamical closure	simultaneous dynamical signature closur	micro=0; held=4; fit=2; real=0; members=0->0	diffusion plus anchor alpha closure c blocker=none
glassbench ka2d 0 23 current closed	real glassbench prediction blocked	micro=0; held=0; fit=0; real=0; members=8->128	real signature support not microdyna blocker=physical time semantics
glassbench ka2d 0 30 current closed	real glassbench prediction blocked	micro=0; held=0; fit=0; real=0; members=8->128	real signature support not microdyna blocker=sparse time code coverage

The scorecard allows dynamical-signature closure claims only for held-out prediction rows; thermodynamic glass-transition claims remain out of scope.
