

GlassBench real-data acquisition design

The next real-data panels are separated by decision power, event-clock inversion, and late-recovery mechanism selection.

rank	acquisition panel	decision power and claim unlocked
#1	multi temperature threshold sweep member panel	members +4; lags +2; pooled substitution=0; threshold=1; PE=0; mechanism=0; thermo=0 stage=member power extension required payload=physical time axis;nonrecrossing cage jump rule;member level threshold sensitivity;membre
#2	physical time event clock inversion panel	members +0; lags +0; pooled substitution=0; threshold=0; PE=1; mechanism=0; thermo=0 stage=real pe inversion panel required payload=frame time mapping;lag time;sigma msd;sigma ngp 2d;sigma self intermediate scattering by
#3	tc50 late recovery mechanism power panel	members +120; lags +0; pooled substitution=0; threshold=0; PE=0; mechanism=1; thermo=0 stage=late recovery member power extension required payload=observe tc50 late ngp;sigma late ngp;late self van hove tail;exchange clock fit

This design makes the next empirical test explicit; none of the panels permits a thermodynamic transition claim.
