

GlassBench direct-alpha transport proxy

The direct-alpha crossing is matched to cached displacement transport while event-clock inversion remains blocked.

target	transport stage	matched alpha/transport proxy
KA2D T=0.23	cached direct alpha transport proxy ready event	structure=151; crossing=tc40; tau_alpha=1.5e+06; MSD=0.975 D_eff=1.62e-07; D_eff tau_alpha=0.244; NGP=2.12; proxy=1 blocker=event_clock_trajectory; next=extract_particle_event_clock_for_persisten
KA2D T=0.30	direct alpha crossing upstream incomplete	structure=none; crossing=none; tau_alpha=0; MSD=0 D_eff=0; D_eff tau_alpha=0; NGP=0; proxy=0 blocker=direct_alpha_threshold_crossing; next=complete_direct_alpha_curve_threshold_cros

This transport-alpha product is a cached displacement proxy, not a persistence/exchange event-clock inversion.
