

Microdynamic minimality audit

Prediction claims require persistence, exchange, jump variance, and cage scale; missing inputs remain underidentified or fit-only.

row	minimality stage	inputs / held-out	missing inputs
full event clock statistics	necessary microstatistics sufficient	missing=0; held=4; fit=0; risk=0	none
missing exchange clock	required microstatistics missing	missing=1; held=0; fit=0; risk=0	exchange mean
macro fit only alpha transport	macro fit only overclaim risk	missing=4; held=0; fit=2; risk=1	persistence mean;exchange mean
glassbench ka2d 0 23 current closed	real data microdynamic inputs missing	missing=4; held=0; fit=0; risk=0	physical time semantics;cage jump
glassbench ka2d 0 30 current closed	real data microdynamic inputs missing	missing=4; held=0; fit=0; risk=0	physical time semantics;cage jump

This audit is a minimality and overclaim guard for dynamical predictions, not a thermodynamic glass-transition derivation.
