

SOTA dynamic-signature alignment

Model diagnostics, literature claims, and current GlassBench evidence are aligned without promoting thermodynamic or fit claims.

signature	alignment stage	support and blocker
msd growth cage escape	real curve supported	model=1; literature=1; real=1; inversion=0; thermo=0 phenomenon=cage plateau transient ngp van hove tail blocker=none
self intermediate alpha	real curve supported pre alpha threshold	model=1; literature=1; real=1; inversion=0; thermo=0 phenomenon=self intermediate scattering alpha relaxation blocker=alpha threshold crossing
transient ngp peak	real curve supported	model=1; literature=1; real=1; inversion=0; thermo=0 phenomenon=cage plateau transient ngp van hove tail blocker=none
chi4 dynamic heterogeneity pro	real proxy supported spatial boundary	model=0.5; literature=1; real=1; inversion=0; thermo=0 phenomenon=chi4 peak and dynamic length growth blocker=direct four point function and dynamic length
persistence exchange decouplin	model literature supported real inversio	model=1; literature=1; real=0; inversion=0; thermo=0 phenomenon=persistence exchange decoupling blocker=alpha threshold crossing
thermodynamic transition	scope boundary not explained	model=0; literature=1; real=0; inversion=0; thermo=0 phenomenon=configurational entropy and ideal glass scope blocker=thermodynamic input law

Rows with real support are dynamical signatures only; persistence/exchange inversion and thermodynamic claims remain separately gated.
