

GlassBench direct-alpha displacement-tail bound

Direct-lag displacement tails are compared with the PE single-event jump-variance bound.

target	tail-bound stage	direct displacement tail vs PE bound
KA2D T=0.23	direct displacement tail exceeds pe single event	structure=151; crossing=tc40; samples=25800; q_all/q_max=1 tail fraction above bound=0.235; tail mean/q_max=3.69; q90=1.39; q95=2.37 blocker=event_segmentation; next=segment_particle_cage_jump_events_and_meas
KA2D T=0.30	pe feasibility bound upstream incomplete	structure=none; crossing=none; samples=0; q_all/q_max=0 tail fraction above bound=0; tail mean/q_max=0; q90=0; q95=0 blocker=pe_feasibility_bound; next=complete_direct_alpha_pe_feasibility_bound

A broad direct-lag tail is a segmentation target, not yet a measured persistence/exchange event clock.
