

GlassBench direct-alpha PE feasibility bound

Direct-alpha transport constrains PE jump variance, but event-clock jump statistics remain missing.

target	PE feasibility stage	conditional identifiability bound
KA2D T=0.23	direct alpha transport bounds pe but event clock	structure=151; q_max=0.486; q_max/MSD=0.498; full-MSD feasible=0 at q=0.2 MSD: tau_x=6e+05; tau_p=1.41e+06; tau_p/tau_x=2.35 blocker=event_clock_jump_variance; next=measure_cage_jump_event_variance_from_part
KA2D T=0.30	direct alpha transport upstream incomplete	structure=none; q_max=0; q_max/MSD=0; full-MSD feasible=0 at q=0.2 MSD: tau_x=0; tau_p=0; tau_p/tau_x=0 blocker=direct_alpha_transport_proxy; next=complete_direct_alpha_transport_proxy

These are conditional PE bounds from alpha/transport; real inversion requires measured event-clock jump variance.
