

GlassBench finite-exchange falsification envelope

The censored persistence fit gives a conditional τ_p/τ_x lower bound and a late-NGP follow-up horizon.

target	envelope stage	conditional finite-exchange consequence
KA2D T=0.23	finite exchange falsification horizon ready	structure=151; $\tau_p/\tau_x \geq 3.65$; recovery lag $\leq 4.3e+07$; follow-up multiplier=28.6 $\tau_p=5.47e+06$; $\tau_\alpha=1.5e+06$; current recovery power=0 blocker=late_ngp_followup_and_exchange_clock; next=measure_late_ngp_or_van_hove_at_recovery_hor
KA2D T=0.30	finite exchange envelope upstream incomplete	structure=3; $\tau_p/\tau_x \geq 0$; recovery lag ≤ 0 ; follow-up multiplier=0 $\tau_p=0$; $\tau_\alpha=0$; current recovery power=0 blocker=interval_censored_persistence_fit; next=complete_interval_censored_persistence_fit
KA2D T=0.30	finite exchange envelope upstream incomplete	structure=none; $\tau_p/\tau_x \geq 0$; recovery lag ≤ 0 ; follow-up multiplier=0 $\tau_p=0$; $\tau_\alpha=0$; current recovery power=0 blocker=interval_censored_persistence_fit; next=complete_interval_censored_persistence_fit

This is a conditional acquisition target, not a measured exchange clock or thermodynamic glass-transition claim.
