

GlassBench first-NPZ particle cache contract

The contract pins byte ranges, NPZ identity, coordinate shape, and the local cache target needed before real event-clock sweeps.

target	contract stage	coordinate-cache payload
KA2D T=0.23	first npz particle cache contract ready time block	shape=20x1290x2; npz=465710 B; md5=26b4b9af10; cache=1; blocker=physical_time_semantics range=2980602255-2984796558; target=data/third_party/glassbench/particle_cache/glassbench_ka2d_T0_23_first_n
KA2D T=0.30	first npz particle cache contract ready time block	shape=20x1290x2; npz=444786 B; md5=f51fd76f59; cache=1; blocker=physical_time_semantics range=464175-4658478; target=data/third_party/glassbench/particle_cache/glassbench_ka2d_T0_30_first_n

This is an extraction contract, not a cached coordinate array or a completed real threshold sweep.
