

GlassBench late-recovery experiment design

The public-window gap is converted into a minimal tc50 follow-up for Gaussian recovery and static-disorder rejection.

target	experiment stage	minimum acquisition and decision rules
KA2D T=0.23 s=151	minimal tc50 followup ready	required=tc50; current=tc40; planned/min=3.86; min lag=4.3e+07; planned lag=1.66e+08 observables=MSD;NGP;F_s(k,t);self_van_hove_tail;member_uncertainty finite-exchange rule: late NGP <= 0.05; static rejection: late NGP + 2sigma < 0.1 blocker=public_glassbench_timecode_ceiling; next=measure_required_observables_at_tc50
KA2D T=0.30 s=3	finite exchange envelope upstream	required=none; current=none; planned/min=0; min lag=0; planned lag=0 observables=MSD;NGP;F_s(k,t);self_van_hove_tail;member_uncertainty finite-exchange rule: late NGP <= 0.05; static rejection: late NGP + 2sigma < 0.1 blocker=finit_e_exchange_envelope; next=complete_finite_exchange_falsification_envelope
KA2D T=0.30 s=none	finite exchange envelope upstream	required=none; current=none; planned/min=0; min lag=0; planned lag=0 observables=MSD;NGP;F_s(k,t);self_van_hove_tail;member_uncertainty finite-exchange rule: late NGP <= 0.05; static rejection: late NGP + 2sigma < 0.1 blocker=finit_e_exchange_envelope; next=complete_finite_exchange_falsification_envelope

This is a dynamical-signature follow-up design; it does not license thermodynamic glass-transition claims.
