

# GlassBench microdynamic closed-loop audit

Real frame-index microstatistics, real macro dynamical signatures, and missing cage-jump clock inputs are separated.

| target      | closed-loop stage                            | micro-to-macro evidence status                                                                                                                                                                                                                                        |

| KA2D T=0.30 | macro timecode upstream incomplete           | frame microstats=1; macro signatures=0; prediction=0; blocker=sparse_time_code_coverage<br>cage proxy=0.0735; short NGP peak=0.142; short Fs decay=0.0036; signatures=0<br>missing=physical_time_semantics;cage_jump_event_segmentation;persistence_exchange_event_cl |

This convergence audit blocks held-out micro-to-macro prediction claims until cage jumps and clocks are extracted.
