

GlassBench sparse-lag event-clock audit

The lag ladder is promoted only to a coarse interval candidate; explicit replica identity remains a blocker.

target	sparse-lag stage	event-clock evidence and blocker
KA2D T=0.23	sparse lag tensor ready replica identity unverify	structure=151; coverage=1.00; lags=8; shape=20x1290x2 same initial=1; tensor=1; candidate=1; replica IDs=0; resolution=sparse_lag_interval blocker=replica_identity_alignment; next=verify_stable_replica_ids_or_segment_with_
KA2D T=0.30	sparse lag event clock upstream incomplete	structure=3; coverage=0.00; lags=0; shape=20x1290x2 same initial=1; tensor=0; candidate=0; replica IDs=0; resolution=none blocker=time_code_coverage; next=extract_all_required_time_code_particle_ca
KA2D T=0.30	sparse lag event clock upstream incomplete	structure=none; coverage=0.00; lags=0; shape=mixed_or_missing same initial=0; tensor=0; candidate=0; replica IDs=0; resolution=none blocker=time_code_coverage; next=extract_all_required_time_code_particle_ca

This narrows the blocker from missing lag data to explicit replica-identity alignment and interval-censored segmentation.
