

Shape-class mechanism selection

T=0.45, identical 18 replicate-lag cells; held-out MSD and NGP are diagnostic inputs

● k=2

● k=4

● k=7.25

Result: all tested factorized event-path closures fail; both positive variance-mixture resummations pass.

Diagnostic shape-class selection only; no unique family, static/finite exchange, cage-jump coupling, or microscopic mechanism is identified.
