

GlassBench alpha-threshold horizon audit

Tau-alpha metadata and the observed k-grid are checked against the $F_s=e^{-1}$ anchor used by the persistence/exchange inversion.

target	audit stage	threshold and inversion status
KA2D T=0.23	metadata tau alpha anchor fs mismatch	tau reached=1; alpha crossed=0; consistent=0; blocker=alpha_anchor_wave_number_outside_observed_grid latest t/tau_alpha(meta)=1.63; anchor $F_s=0.763$; extension=1.64e+03x $k^*=2.7$; $k^*/k_{max}=1.69$; PE inversion=0; next=extend_or_recompute_glassbench_fs_at_alpha_anchor_wave_num
KA2D T=0.30	timecode curve upstream incomplete	tau reached=0; alpha crossed=0; consistent=0; blocker=sparse_time_code_coverage latest t/tau_alpha(meta)=5e-05; anchor $F_s=0$; extension=0x $k^*=0$; $k^*/k_{max}=0$; PE inversion=0; next=complete_timecode_curve_before_alpha_horizon_audit

A metadata/anchor- F_s mismatch blocks real-data inversion until the alpha wave number, definition, or horizon is resolved.
