

GlassBench threshold-sweep decision power plan

Threshold-sweep decisions require independent member-level uncertainty, not pooled replica-particle counts.

target	decision-power stage	member-level uncertainty requirement
KA2D T=0.23 structure=151	independent member extension required	members=1/3; add=2; pooled particles allowed=0 required columns=member_mean_persistence_sensitivity_ratio;member_max_post_crossing_recross_fratio blocker=independent_member_uncertainty; next=extract at least 2 additional independent members and comp
KA2D T=0.30 structure=3	independent member extension required	members=1/3; add=2; pooled particles allowed=0 required columns=member_mean_persistence_sensitivity_ratio;member_max_post_crossing_recross_fratio blocker=independent_member_uncertainty; next=extract at least 2 additional independent members and comp

This gate prevents pooled particle counts from being misread as independent evidence for event-clock robustness.
