

Simultaneous dynamical-signature closure gate

A minimal D plus anchor-alpha inversion must pass held-out alpha, late-NGP, SE-growth, and chi4-proxy checks.

protocol	closure stage	held	pass	SE growth	blocker
synthetic minimal dynamical closur	simultaneous dynamical signature closure pas held-out: tau alpha(k!=anchor);late ngp recovery;stokes einstein growth;chi4 proxy peak	4	1	3.56	none
synthetic chi4 mismatch closure	dynamical heldout prediction failed held-out: tau alpha(k!=anchor);late ngp recovery;stokes einstein growth;chi4 proxy peak	4	0	3.56	chi4 peak z consistent
