

GlassBench direct-alpha event-clock extraction contract

This gate separates a real segmentation target from a true persistence/exchange event-clock inversion.

target	contract stage	required evidence before PE inversion
KA2D T=0.23	segmentation target ready true event clock missing	structure=151; q_max=0.486; PE=1; tail=1; target=1; true-time=0 tail above=0.235; ever crossed=0.24; first-cross q/q_max=3.44 required=positions[time,particle,dimension];time_or_lag;trajectory_id;box_or_unwrap blocker=physical_time_trajectory_axis; next=extract_positions_time_particle_dimension_
KA2D T=0.30	event clock contract upstream incomplete	structure=none; q_max=0; PE=0; tail=0; target=0; true-time=0 tail above=0; ever crossed=0; first-cross q/q_max=0 required=positions[time,particle,dimension];time_or_lag;trajectory_id;box_or_unwrap blocker=pe_feasibility_bound; next=complete_direct_alpha_pe_feasibility_bound

Direct-lag and lag-ladder evidence constrain the target, but cached replica axes are forbidden substitutes for true time trajectories.
