

GlassBench real-inversion unlock protocol

Minimum additional payload required before promoting real-data canaries to uncertainty-weighted trajectory inversion.

target	unlock stage	minimum missing payload
KA2D T=0.23	minimum real inversion payload missing	frames=20; result times=8; mapping=0; extra members=1 payload: frame time mapping;one more independent npz member;lag time;self intermediate scattering by k;c after unlock: uncertainty weighted real trajectory inversion
KA2D T=0.30	minimum real inversion payload missing	frames=20; result times=6; mapping=0; extra members=1 payload: frame time mapping;one more independent npz member;lag time;self intermediate scattering by k;c after unlock: uncertainty weighted real trajectory inversion
