

GlassBench direct-alpha shape selection

A threshold-anchored exponential alpha null is compared with KWW shape while overclaim blockers remain explicit.

target	shape-selection stage	alpha-shape evidence
KA2D T=0.23	cached alpha shape stretched candidate uncertain	structure=151; beta=0.159; delta AIC=41.6; points=8 RMSE exp=7.77; RMSE KWW=0.51; candidate=1; claim=0 blocker=nonmonotone_sparse_curve_and_missing; next=measure_monotone_uncertainty_weighted_mult
KA2D T=0.30	cached alpha shape selection upstream incomplete	structure=none; beta=0; delta AIC=0; points=0 RMSE exp=0; RMSE KWW=0; candidate=0; claim=0 blocker=direct_alpha_curve; next=complete_direct_alpha_curve_before_shape_s

The cached curve supports a stretched-alpha candidate only; nonmonotone sparse data and missing uncertainties block a real fit claim.
