

GlassBench time-code curve bridge

Corrected KA2D physical-time rows are translated into the trajectory PE pre-inversion schema without promoting blockers.

target	bridge stage	real-data inversion status
KA2D T=0.23	glassbench timecode curve bridge incomp	lags=8; tc curve=1; real curve=1; PE inversion=0; blocker=alpha_threshold_crossing latest t/tau_alpha=1.63; anchor Fs=0.763; D-window=0; thermodynamic claim=0 next=extend_timecode_curve_until_alpha_threshold_crossing
KA2D T=0.30	glassbench timecode curve upstream inco	lags=1; tc curve=0; real curve=0; PE inversion=0; blocker=sparse_time_code_coverage latest t/tau_alpha=0; anchor Fs=0; D-window=0; thermodynamic claim=0 next=extract_members_across_all_official_time_codes

This promotes one real physical-time GlassBench curve to a quantitative pre-inversion blocker, not to a completed real-data fit.
