

GlassBench event-clock threshold readiness

Real threshold-robustness claims require cached particle trajectories, physical time, and held-out macro observables.

target	readiness stage	real-input gate
KA2D T=0.23	real event clock threshold robustness blocked	schema=1; curve=1; members=1; particle cache=0; threshold sweep=0; blocker=particle_resolved_position; missing=particle_resolved_positions_cache;physical_time_semantics;macro_heldout_observables;threshol
KA2D T=0.30	real event clock threshold robustness blocked	schema=1; curve=1; members=1; particle cache=0; threshold sweep=0; blocker=particle_resolved_position; missing=particle_resolved_positions_cache;physical_time_semantics;macro_heldout_observables;threshol

The gate is intentionally conservative: schema visibility is not treated as a real particle-event threshold sweep.
